

How a Person Gets CF

To have CF, you must inherit two copies of the CFTR gene that contain mutations – one copy from each parent. That means that each parent must either have CF or be a carrier of a CFTR gene mutation.

When two people who are carriers have a child, there is a 25 percent chance of having a child with CF.

When one parent has CF and one parent is a carrier, there is a 50 percent chance of having a child with CF.
